

# Heater Controllers

## Thermic Edge PID Heater Controllers

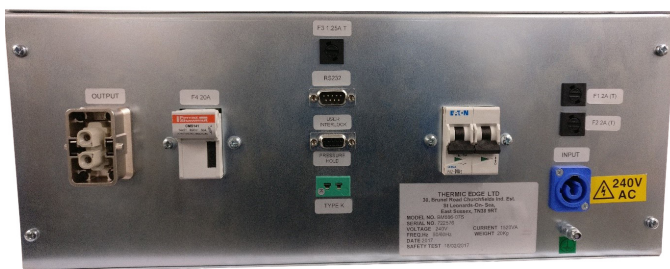

### Thermic Edge Heater Controller

The Thermic Edge heater controllers are fit for various purposes to suit your needs, delivering stable and efficient ways of meeting your desired temperatures, using our smart-learning PID in-built computer controllers. Our controllers use all of the best components inside, and are the best solution for adapting your heaters to their environments, no matter the conditions.

### PID Controller Technology

Our heater controller contains a PID controller which is a learning system designed to give a 0 - 10 v signal, controlling any powersupply so you can set the signal and then it will supply it with the correct power required to hit your desired temperature without overshooting.

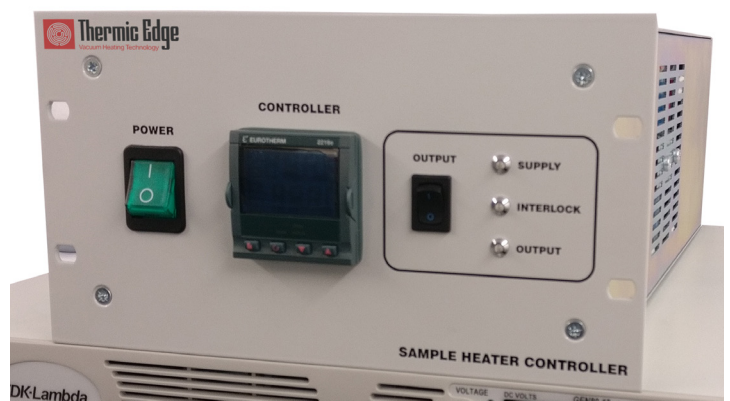

All Thermic Edge equipment is built with longevity and safety in mind.

### Applications in the workplace

Using this heater controller in conjunction with our range of furnaces gives unprecedented performance and accuracy in your temperatures when ramping up and down.

Alternatively, using our heater controllers with ANY power supply will work perfectly with this. Pin-point accuracy and absolute control over your workshop can finally be achieved, only with Thermic Edge hardware.
